

INTERNATIONAL MALAYSIA & SINGAPORE PLANT VISIT NARRATIVE REPORT**STUDENT NAME:** Marc Francis A. Paguyo**TITLE:** International Malaysia & Singapore Plant Visit Narrative Report**VENUE / DATE & TIME** Malaysia & Singapore –14-20 July 2025**COMPANIES:** Sunway University, MIMOS, UTM, Alibaba Cloud, ICpEP**INSIGHTS AND LEARNINGS**

During our 6-day tour and 5 plant visits, I learned a great deal about various technologies at several universities and plants. On the first day, we visited Sunway University. At this university, I encountered a lot of robotics labs that enable students to create and innovate robots and expand their knowledge in computer engineering and hardware. Some laboratories contain different 3d printing machines, carpentry laboratories with new high-tech tools, and a computer laboratory that has high-quality desktops. I am also overwhelmed that, with the help of technology, Sunway has transformed from a huge mining site to a new city. Back then, it was like a huge sinkhole, but now it is a huge rich city. Sunway University offers a good quality education since it is partnered with Harvard University. They offered a lot of computer-related programs like Bachelor of Science in Computer Science major in Artificial Intelligence, and Bachelor of Mechatronic Engineering (Robotics) with Honours. I had a good time visiting Sunway University because it is my first time delving into a top university in a different country with high-quality education.

For the next site, we visited MIMOS, also known as Malaysia's National Applied Research and Development Center. Here, I discovered how they create robots with sensors and what equipment, tools, and accessories they use to create the robots. I got introduced to LiDAR, which contributes a lot to the sensor of the robot, and also to some type of vision sensor like RGB, RGB-D, and Time-of-Flight. I also gained more knowledge about automation and how they apply it is applied in UGV and ROV. MIMOS focuses on robots that will help them

with farming palm oil. They create self-operating vehicle-like robots with the help of visual sensors and Robot Operating System.

For our third site, we visited the Universiti Teknologi Malaysia. In here, I am informed that the university is more focused on research rather than conducting several hardware or software projects. They aim to be a good university in conducting research on data science and security. They reached the 153rd ranking worldwide, which is quite recognizable since there are a lot of universities in the world. They often conduct seminars about computers or technologies like blockchain and hackathons in different places and universities. One thing I like about my visit is that I encountered a hacking room where students are welcome to develop their hacking and cybersecurity skills by hacking a server and protecting it. The server is overwhelming since it is huge, and it also has a backup in case there is an emergency.

The fourth visit occurred in the Singapore branch of Alibaba Cloud. In this visit, we are educated about the history of Alibaba Cloud, what AI is, and the different types of AI that Alibaba makes. There are different chat AIs right now. There is ChatGPT by OpenAI, and Gemini by Google, and in our visit, I learned that Alibaba also has its own AI, which is Qwen. There are many different AI that Alibaba makes, like an AI that generates a photo or picture, an AI for lip sync, an AI for turning a picture into a video, and more. I was amazed by this experience since I got to see how rich the company is to be able to produce a lot of computing products and services.

For the last visit, we went to the Institute of Computer Engineers of the Philippines, where we were introduced to Singapore's Operational Technology Cybersecurity Masterplan. Although the seminar was brief, it provided us with valuable insights into the growing importance of cybersecurity in protecting critical infrastructure and industrial systems. We learned how operational technology differs from traditional IT and how threats in this field can impact public safety, national security, and economic stability. The session emphasized the need for continuous collaboration, awareness, and skill development in cybersecurity to address evolving threats in the digital landscape. Overall, the seminar sparked our interest in pursuing further knowledge in this essential and rapidly growing area.

To sum up, the 6-day educational tour turned out to be a life-altering experience that greatly expanded our knowledge of the practical embodiment of computer engineering and subsequent technologies. All the site visits were occurring in different fields: robotics and automation (both at Sunway University and MIMOS), research and cybersecurity (Universiti Teknologi Malaysia), the latest AI solutions (Alibaba Cloud), and the protection of critical infrastructure (with Singapore and its OT Cybersecurity Masterplan). All these experiences not only enhanced our technical expertise but also made us eager to maintain curiosity, creativity, and never-ending learning to keep pace with the rapidly changing world of technology. This tour has also encouraged us to have a love of the field and to work towards being able to make a relevant contribution to the progress of technology in the future.

IT

Refers to systems that process, store, and transmit data—such as enterprise applications, email, cloud services, and databases.

IT focuses on data confidentiality, integrity, and availability.

OT

Refers to systems that monitor and control physical processes in industrial environments—such as SCADA systems, PLCs, DCS, and sensors in power plants, factories, and utilities.

OT prioritizes safety, reliability, and uptime.
